

BACKEND TEST AUTOMATION FROM THE SCRATCH

IGOR BALAGUROV

QA AUTOMATION TECH LEAD AT VK

- vk.com/korgan
- linkedin.com/in/ibalagurov
- github.com/ibalagurov

VK EXPERIENCE

- ▶ VK Payment systems
 - ▶ Wallets (VK Pay), Card2Card and Card2Wallet transactions
- ▶ Internal Development
 - ▶ A lot of small internal services
- ▶ Performance testing
- ▶ Tooling: static code analysis, code formatters, code coverage, CI integration

OVERVIEW TALK

- ▶ Introduction
- ▶ How to test?
- ▶ How to choose tools?
- ▶ Examples (Python and REST API)
- ▶ What to test in API's next
- ▶ We need go deeper
- ▶ Conclusions

BACKEND TESTING

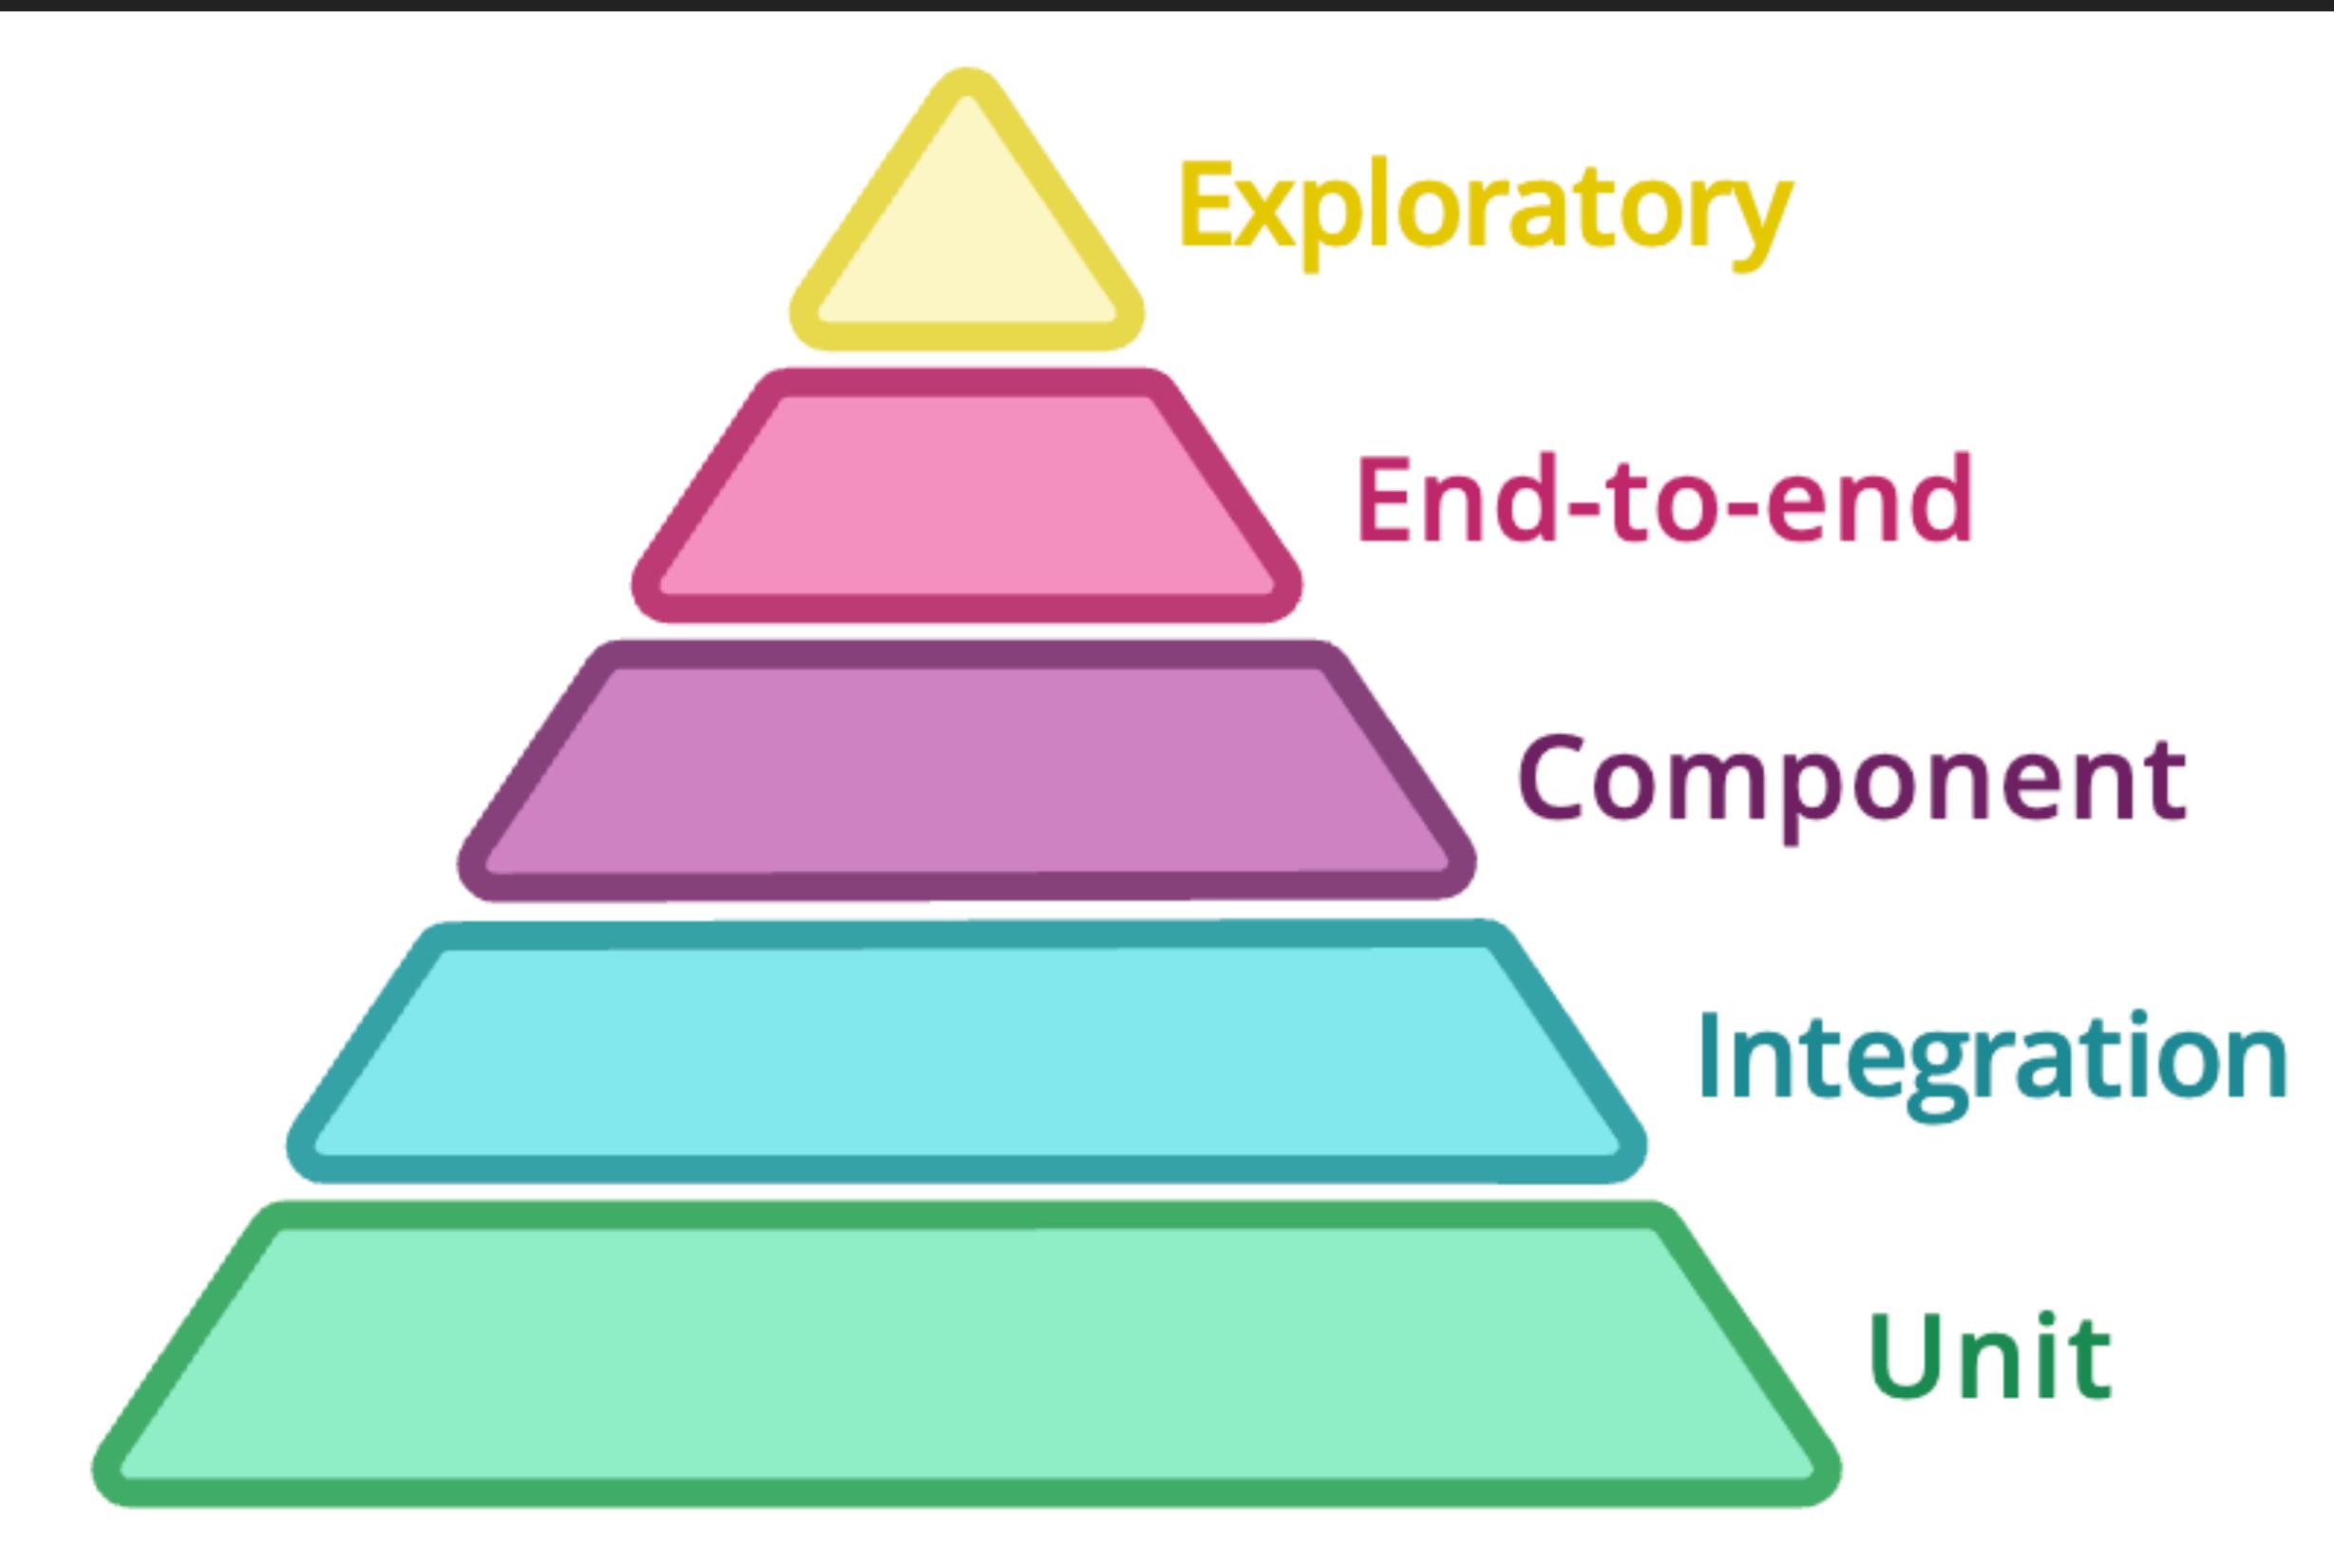

- ▶ Application architecture
- ▶ Different approaches, tools and etc

TEST PYRAMID

- ▶ Too broad conceptions
- ▶ Some layers could be unavailable in your application
- ▶ 3rd parties could change everything

MICROSERVICE TEST PYRAMID

- martinfowler.com
 - microservice testing
 - practical test pyramid

TEST PYRAMID

- ▶ Solve your problems

PROTOCOLS

- ▶ HTTP or not
- ▶ Text and binary
- ▶ Synchronous and asynchronous
- ▶ REST, GraphQL, MQ, gRPC, Thrift, DB

EDGE CASES

- ▶ Configuration
- ▶ BigData
- ▶ Machine Learning

PROTOCOLS

- ▶ Interface
 - ▶ Input and output data
- ▶ Built for programs
 - ▶ Fit for automation

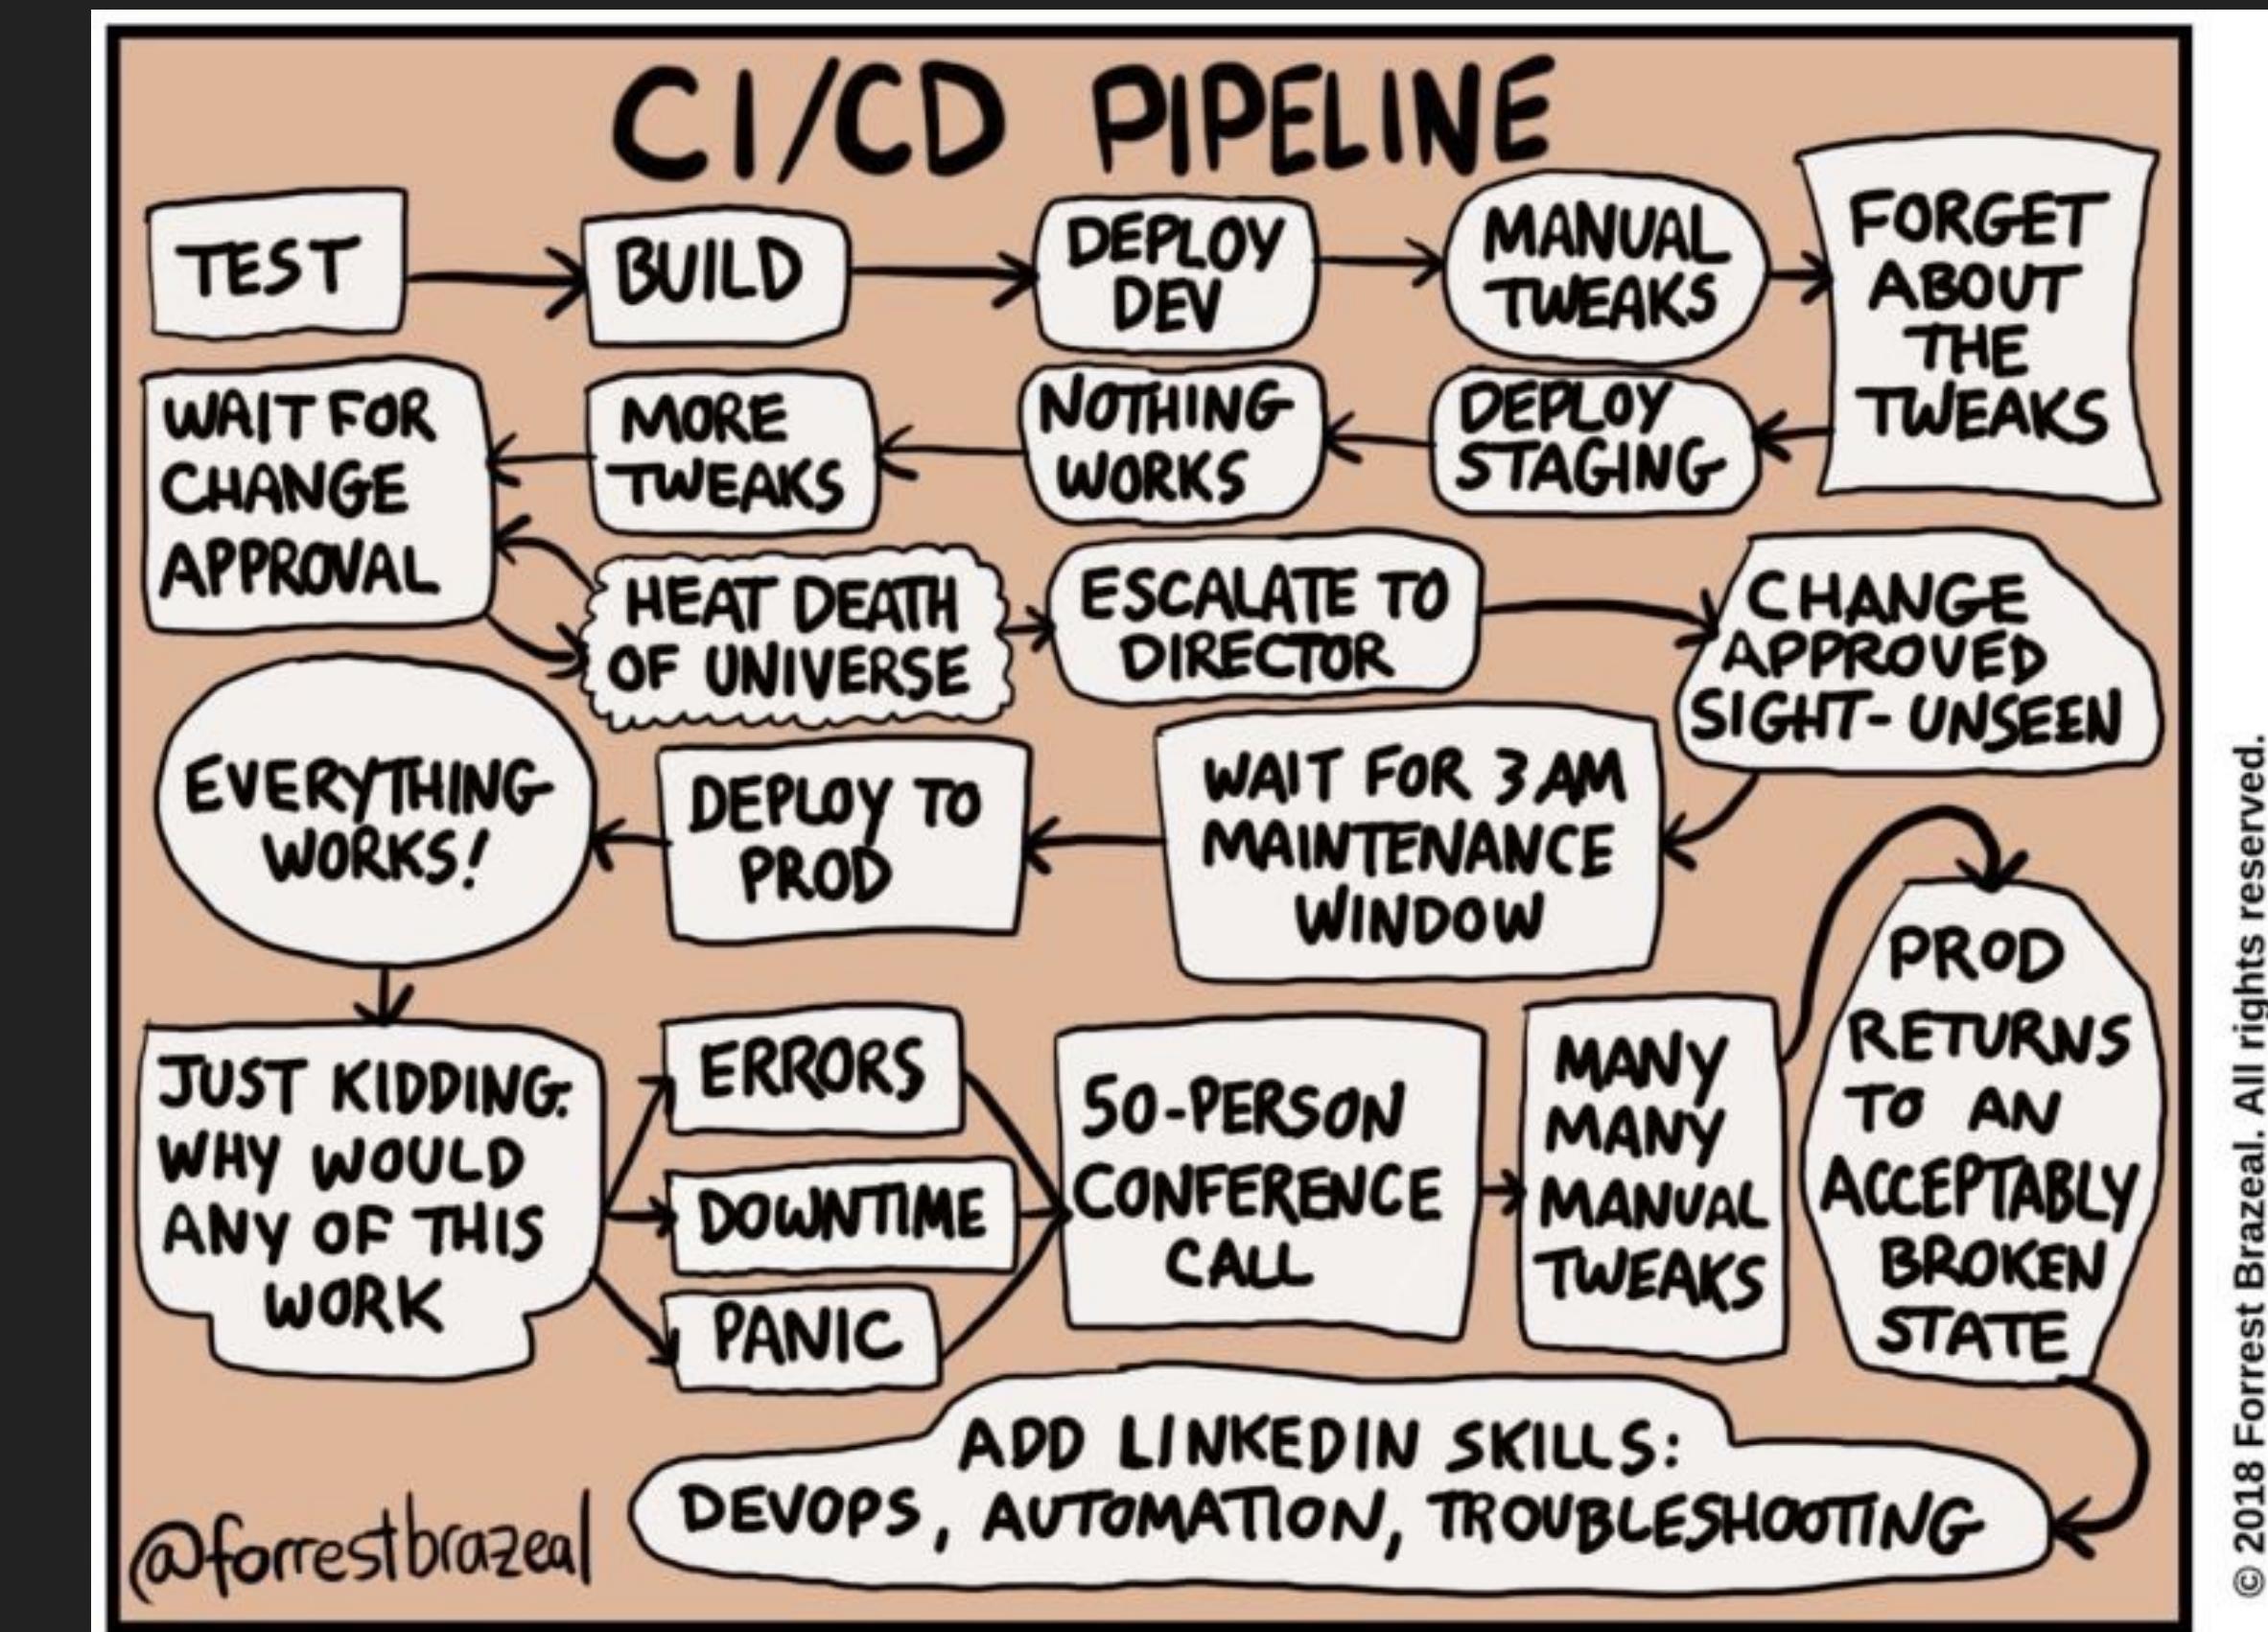

MANUALLY

- ▶ Requirements / Documentation
 - ▶ Usability / UX
 - ▶ Testability
- ▶ Exploratory
 - ▶ Security (Penetration) testing
- ▶ Acceptance
 - ▶ ?

AUTOMATION

- ▶ Fast feedback
- ▶ Reduce Time2Market
- ▶ CI / CD
- ▶ Frequent releases
- ▶ Close to development
- ▶ UI tests preconditions

TOOLS FOR AUTOMATION

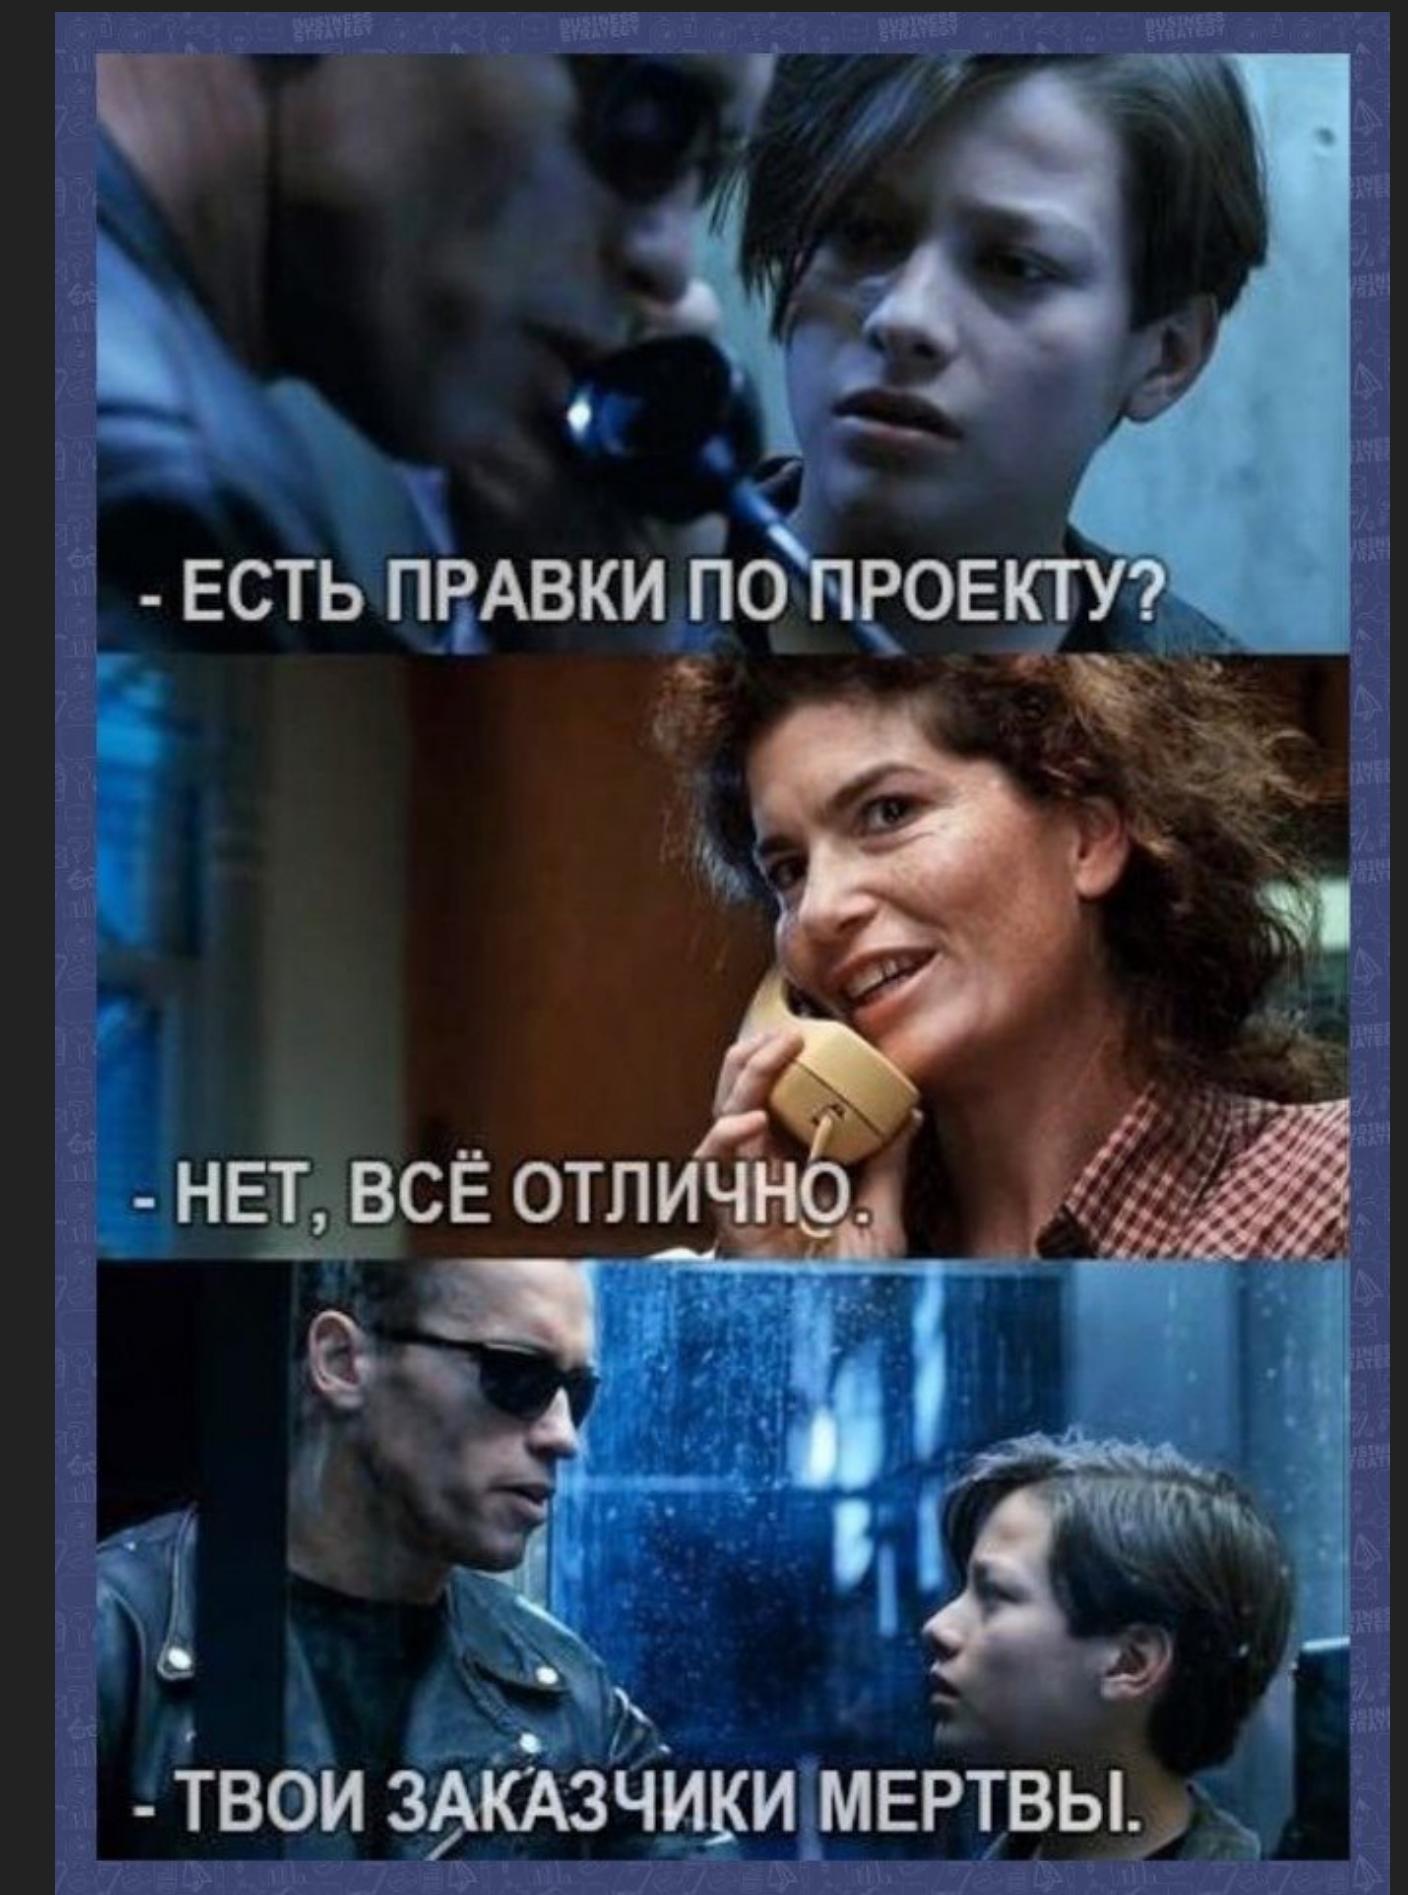

- ▶ Same language with development?
- ▶ Tools for testing
- ▶ Community (StackOverflow ❤)
- ▶ Learning curve
- ▶ Development performance
- ▶ Code performance

EXAMPLES

- ▶ Short project
 - ▶ Manual
 - ▶ Postman
 - ▶ Hello world automation

EXAMPLES

- ▶ Problems
 - ▶ Project became bigger
 - ▶ Throw away old approaches

EXAMPLES

- ▶ Big project
- ▶ Developers write almost all automated tests
- ▶ Small dedicated QA team
 - ▶ Convenient language and tools for QA
 - ▶ Same language?

EXAMPLES

- ▶ Problems
- ▶ Frequent releases
 - ▶ Update tests for new logic
 - ▶ Revert?

EXAMPLES

- ▶ Feature teams
 - ▶ Same repositories
 - ▶ Same technologies?

EXAMPLES

- ▶ Problems
- ▶ Full stack QA Engineers?

EXAMPLES

- ▶ Big project with big QA team(s) (or without QA team at all)
- ▶ Same technologies

EXAMPLES

- ▶ Problems
 - ▶ Your own frameworks, tools and etc
 - ▶ Feature toggles, AB tests

LANGUAGES FOR AUTOMATION (IMHO)

- ▶ C#: few tools for testing
- ▶ Java: a lot of tools
- ▶ Python: easy tools integration, wide community
- ▶ JS: a lot of tools, complex tools integration
- ▶ Ruby: cool tools, but few candidates
- ▶ Go: ?

PYTHON AND REST API

- ▶ Approaches are language agnostic
- ▶ REST API
- ▶ Tools integration examples

PYTEST

- ▶ Plugins
 - ▶ Rerun failures (`pytest-rerunfailures`)
 - ▶ Parallel execution (`pytest-xdist`)
 - ▶ Soft asserts (`pytest-check`)
 - ▶ Many more
 - ▶ Your own

WHY PYTEST

- ▶ Plugins
 - ▶ Fast tests development
 - ▶ Complex tests
- ▶ Good community
- ▶ Nested fixtures
- ▶ Hooks

DEAD SIMPLE CLIENT

```
1 import requests
2
3 response = requests.post(
4     url="https://your-site.com",
5     json={"a": 1}
6 )
7
8 response.request.headers["content-type"]
9
10 # 'application/json'
```

COOKIES AND REDIRECTS

```
1 from requests import Session  
2  
3 session = Session()  
4  
5 session.post(  
6     url="https://your-site.com/auth",  
7     data={"login": 1, "password": 2}  
8 )  
9  
10 response = session.get(  
11     url="https://your-site.com/authenticated"  
12 )
```

CACHED SESSIONS

```
1 from requests import Session
2 from functools import lru_cache
3
4
5 @lru_cache()
6 def user_session(user: User):
7     return Session()
```

WAIT ASYNC OPERATIONS

```
1 import waiting
2 import requests
3
4 waiting.wait(
5     predicate=requests.get(url="...").json()[ "a" ] == 1,
6     timeout_seconds=15,
7     sleep_seconds=( 0.25, 1, 2 ),
8     expected_exceptions=KeyError,
9 )
```

TESTS

- ▶ Risk based scenarios
- ▶ Privacy (role based model)
- ▶ Input / Output equivalence classes and boundary values
- ▶ API methods combinations
- ▶ Based on test coverage lower level tests

EXTEND THEM

- ▶ Random data generation
- ▶ Complex data validation (Response schemas)
- ▶ Base security checks
- ▶ Property based testing

HIDDEN CORNER CASES

- ▶ Pesticide Paradox:
 - ▶ Hardcode values in test data
 - ▶ Inability to variate data across all tests

APPROACH

- ▶ Randomization in getting boundary values and inside equivalence classes
- ▶ Randomization helps to test:
 - ▶ Combinations
 - ▶ Localization
 - ▶ New checks
- ▶ Seed for reproducible tests

TOOLS

- ▶ Momezis
- ▶ Faker

EXAMPLES: POSITIVE CASES

```
1 import mimesis
2
3 generate = mimesis.Generic(locale="en", seed=100500)
4
5 currency = generate.business.currency_iso_code()
6 # 'USD'
7
8 phone = generate.person.telephone()
9 # '1-115-514-0222'
```

EXAMPLES: NEGATIVE CASES

```
1 import mimesis
2
3 generate = mimesis.Generic(locale="en", seed=100500)
4
5 nulls = ["null", "nan", "nil", "none"]
6 random_word = generate.text.word()
7 common = [random_word, *nulls]
8
9 invalid_currency = generate.choice(common)
10 # "none"
```

EXAMPLES: PREPARE FOR PARAMETRIZATION

```
1 invalid_param_dict = {  
2     "currency": generate.choice(common)  
3 }  
4  
5  
6 def generate_invalid(param):  
7     return invalid_param_dict.get(param)
```

RANDOMIZATION: PROS & CONS

- ▶ Reusable values
 - ▶ Common for same or similar parameters
 - ▶ It could be used as standalone data generator solution
- ▶ Combinations
- ▶ ...

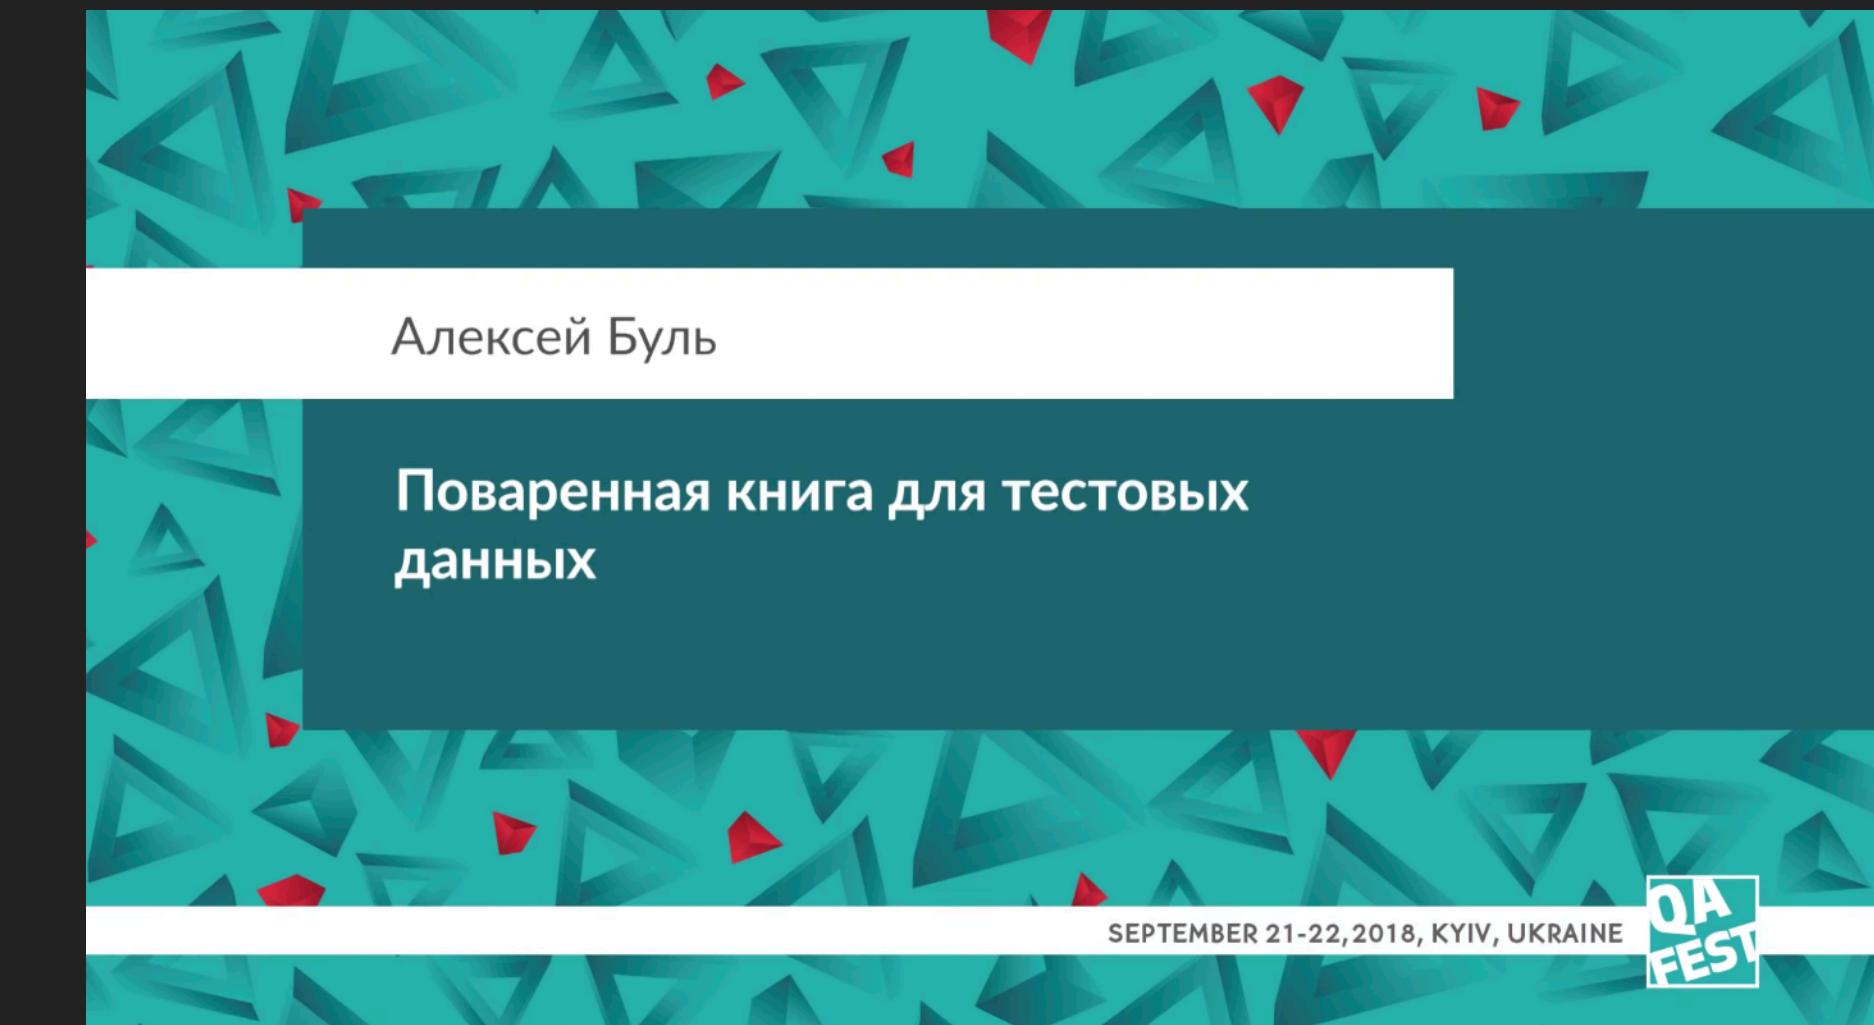

RANDOMIZATION: PROS & CONS

- ▶ Reusable values:
 - ▶ Common for same parameters
 - ▶ It could be used as standalone data generator solution
- ▶ Combinations
- ▶ Sometimes tests fail → Knowledge mining
- ▶ You need the seed to reproduce test

WHAT'S NEXT?

- Mimesis documentation
- Articles (habr)
- Heisenbug 2016 Moscow: Randomized testing
- QA Fest 2018: Поваренная книга для тестовых данных

COMPLEX DATA VALIDATION

- ▶ 3rd-parties data
- ▶ Sensitive data:
 - ▶ Any new field is a risk
- ▶ Contract:
 - ▶ Any new format type is a risk

APPROACH

- ▶ Data validation, schemas
 - ▶ Body contains only predefined fields, in appropriate format
 - ▶ No additional information: in any case, in any place
 - ▶ ...
 - ▶ There is no any sensitive data

TOOLS

- ▶ Cerberus, Pydantic, jsonschema
- ▶ Convenient API: no need in additional conversion
- ▶ All errors in one check
- ▶ Required / Unknown fields
- ▶ Custom rules (any, all, none, dependencies)

EXAMPLES

```
1 from cerberus import Validator
2
3 schema = {'name': {'type': 'string'}}
4
5 v = Validator(schema)
6
7 document = {'name': 'john doe'}
8
9 v.validate(document)
10 # True
```

EXAMPLES

```
1 from src import vk_pay, check
2 from src import data_service
3
4
5 def test_wallet_balance():
6     wallet = data_service.get_wallet()
7
8     response = vk_pay.wallet_balance(wallet=wallet)
9     response.json()
10    # {"data": {"userId": 1, "balance": 100}}
11
12    check.response_matches_ok_schema(response)
```

EXAMPLES

```
1 wallet_balance = {  
2     "data": {  
3         "type": "dict",  
4         "required": True,  
5         "require_all": True,  
6         "schema": {  
7             "balance": {  
8                 "type": "number", "min": 0, "max": 60000  
9             },  
10            "userId": {"type": "integer", "min": 1},  
11        }  
12    }  
13 }
```

EXAMPLES

```
1 ok_mapping = {  
2     "get": {  
3         "/wallet/balance": wallet_balance,  
4     }  
5 }  
6  
7 def for_ok_schema(response):  
8     url = response.request.path_url  
9     method = response.request.method.lower()  
10    return ok_mapping.get(method, {}).get(url)
```

EXAMPLES

```
1 from src import schema
2 from cerberus import Validator
3
4 def response_matches_ok_schema(response):
5     response_schema = schema.for_ok_response(response)
6     data_to_validate = response.json()
7     schema_validator = Validator(response_schema)
8
9     assert schema_validator.validate(data_to_validate), \
10        schema_validator.errors
```

EXAMPLES

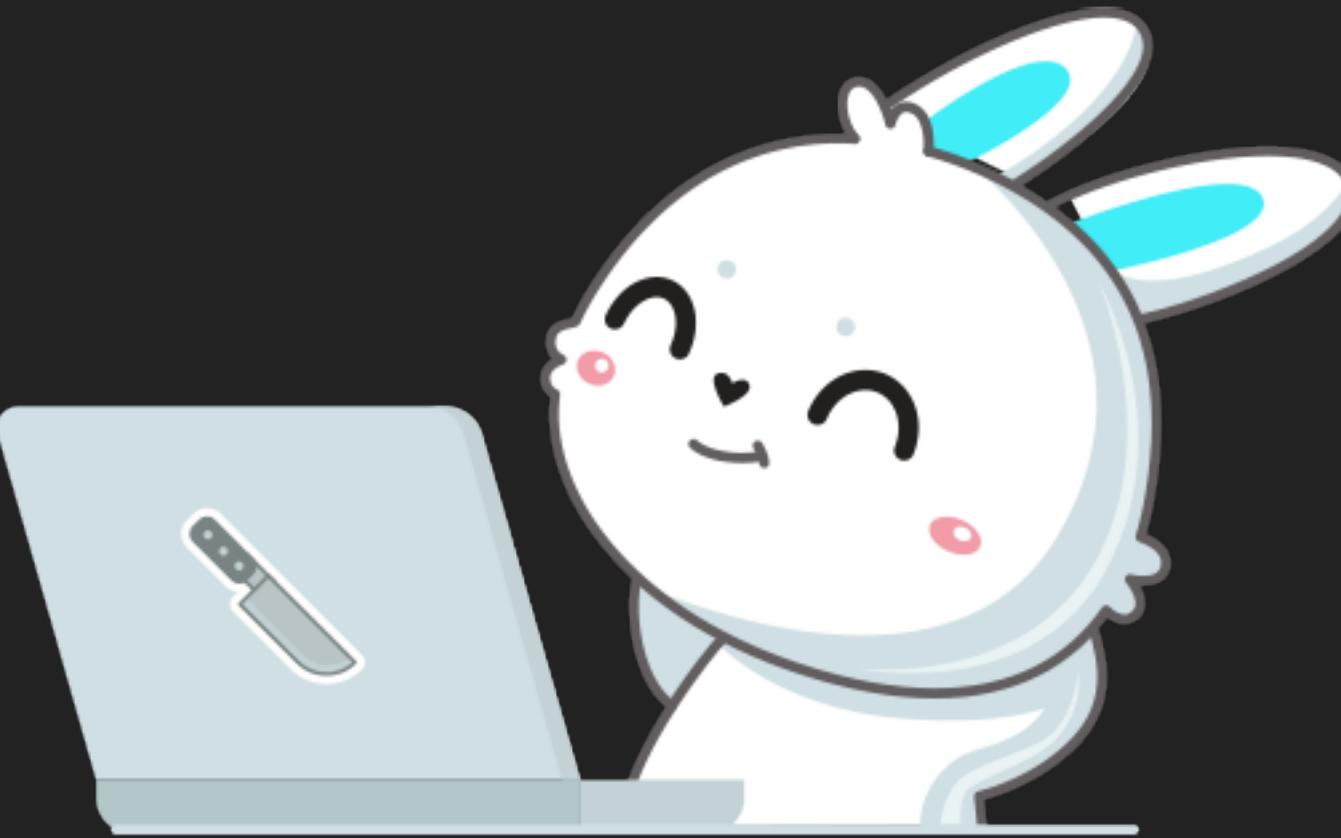

```
1 data_to_validate = response.json()
2 # {"data": {"userId": 0, "balance": -0.1}}
3
4 schema_validator.validate(data_to_validate))
5 # False
6
7 schema_validator.errors
8 # {'data':[{
9 #     'balance': ['min value is 0'],
10 #     'userId': ['min value is 1']
11 # }]}
```

DATA VALIDATION: PROS & CONS

- ▶ Useful with 3rd parties
- ▶ If you want to know about:
 - ▶ Every new field
 - ▶ Any new format
- ▶ ...

DATA VALIDATION: PROS & CONS

- ▶ Useful with 3rd parties
- ▶ If you want to know about:
 - ▶ Every new field
 - ▶ Any new format
- ▶ ...
- ▶ Sometimes tests fail → Knowledge mining
- ▶ You need to describe your schemas

WHAT'S NEXT?

- PiterPy 2018: Cerberus, or Data Validation for Humans
- Cerberus documentation

BASE SECURITY TESTS

- ▶ Security risks
- ▶ Sensitive data
- ▶ Separate security department:
 - ▶ It is not so iterative, as it could be

APPROACH

- ▶ OWASP API Security:
 - ▶ Privacy / Permissions
 - ▶ Wrong tokens / hashes / signs / private keys
 - ▶ Invalid values (overflow attempts, injections)
 - ▶ Rate & Resource limits (flood control)
 - ▶ Race conditions

APPROACH

- ▶ Negative actors → privacy
- ▶ Negative values → resources limits
- ▶ Wrong headers → tokens / hashes
- ▶ ...
- ▶ It's not a problem to extend tests

APPROACH

- ▶ Check every request param
 - ▶ Overflow attempts
 - ▶ Injections
- ▶ Check concurrent responses
 - ▶ Rate limits
 - ▶ Race conditions

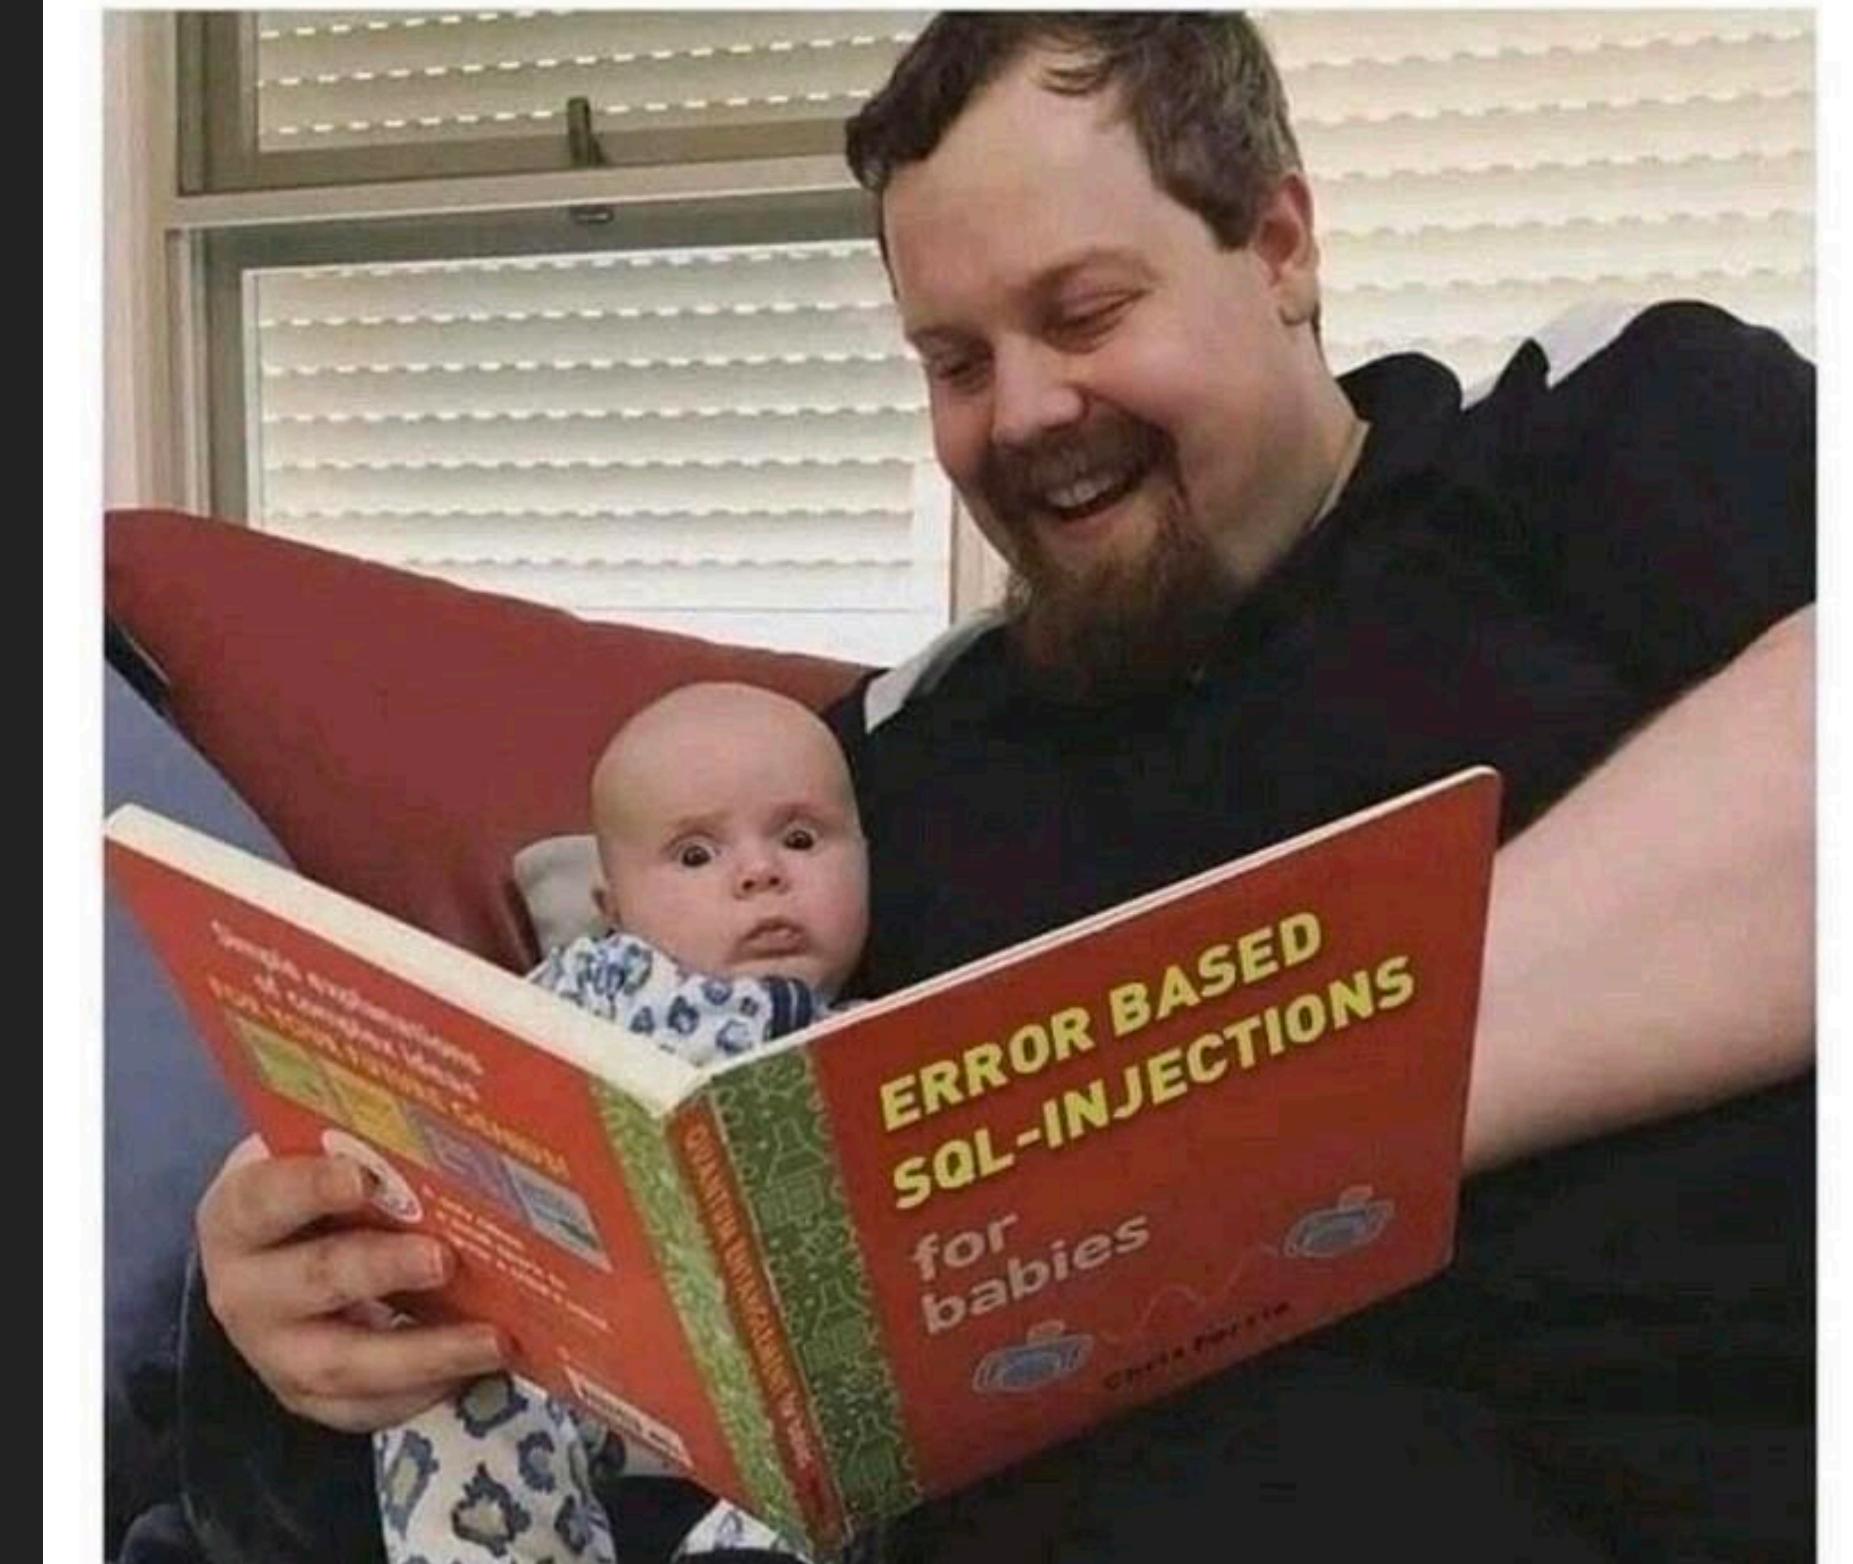

EXAMPLES: NEGATIVE CASES

- ▶ Nulls
- ▶ Invalid format values
- ▶ Non-existent values

EXAMPLES: NEGATIVE CASES

- ▶ Nulls
- ▶ Invalid format values
- ▶ Non-existent values
- ▶ Overflow attempts
- ▶ Injections

When I become a dad ❤️

EXAMPLES: NEGATIVE CASES

```
1 import mimesis
2
3 generate = mimesis.Generic(locale="en", seed=100500)
4
5 nulls = ["null", "nan", "nil", "none"]
6 random_word = generate.text.word()
7 common = [random_word, *nulls]
8
9 invalid_currency = generate.choice(common)
10 # "none"
```

EXAMPLES: NEGATIVE CASES

```
1 overflow_int = "9" * 100
2
3 my_cool_injections = [ " ' OR 1 == 1" ]
4
```

EXAMPLES: NEGATIVE CASES

```
1 import mimesis
2
3 generate = mimesis.Generic(locale="en", seed=100500)
4
5 nulls = ["null", "nan", "nil", "none"]
6 my_cool_injections = ['' OR 1 == 1']
7 overflow_int = "9" * 100
8 common = [overflow_int, *nulls, *my_cool_injections]
9
10 invalid_currency = generate.choice(common)
11 # "none"
```

APPROACH

- ▶ Check every request param
 - ▶ Overflow attempts
 - ▶ Injections
- ▶ Check concurrent responses
 - ▶ Rate limits
 - ▶ Race conditions

APPROACH

- ▶ Check concurrent responses
 - ▶ Rate limits
 - ▶ Race conditions

TOOLS

- ▶ Standard library:
 - ▶ concurrent.futures
 - ▶ threading
 - ▶ asyncio
 - ▶ and etc.

EXAMPLES

```
1 from functools import partial
2 from src import vk_pay, test_data, parallel
3
4 transaction_id = test_data.create_transaction()
5
6 api_method = partial(
7     func=vk_pay.confirm_transaction,
8     transaction_id=transaction_id
9 )
```

EXAMPLES

```
1 def test_race_condition():
2     responses = parallel.execute(
3         func=api_method, times=10
4     )
5
6     ok_responses = [
7         response.status_code == 200
8         for response in responses
9     ]
10
11    assert len(ok_responses) == 1
```

EXAMPLES

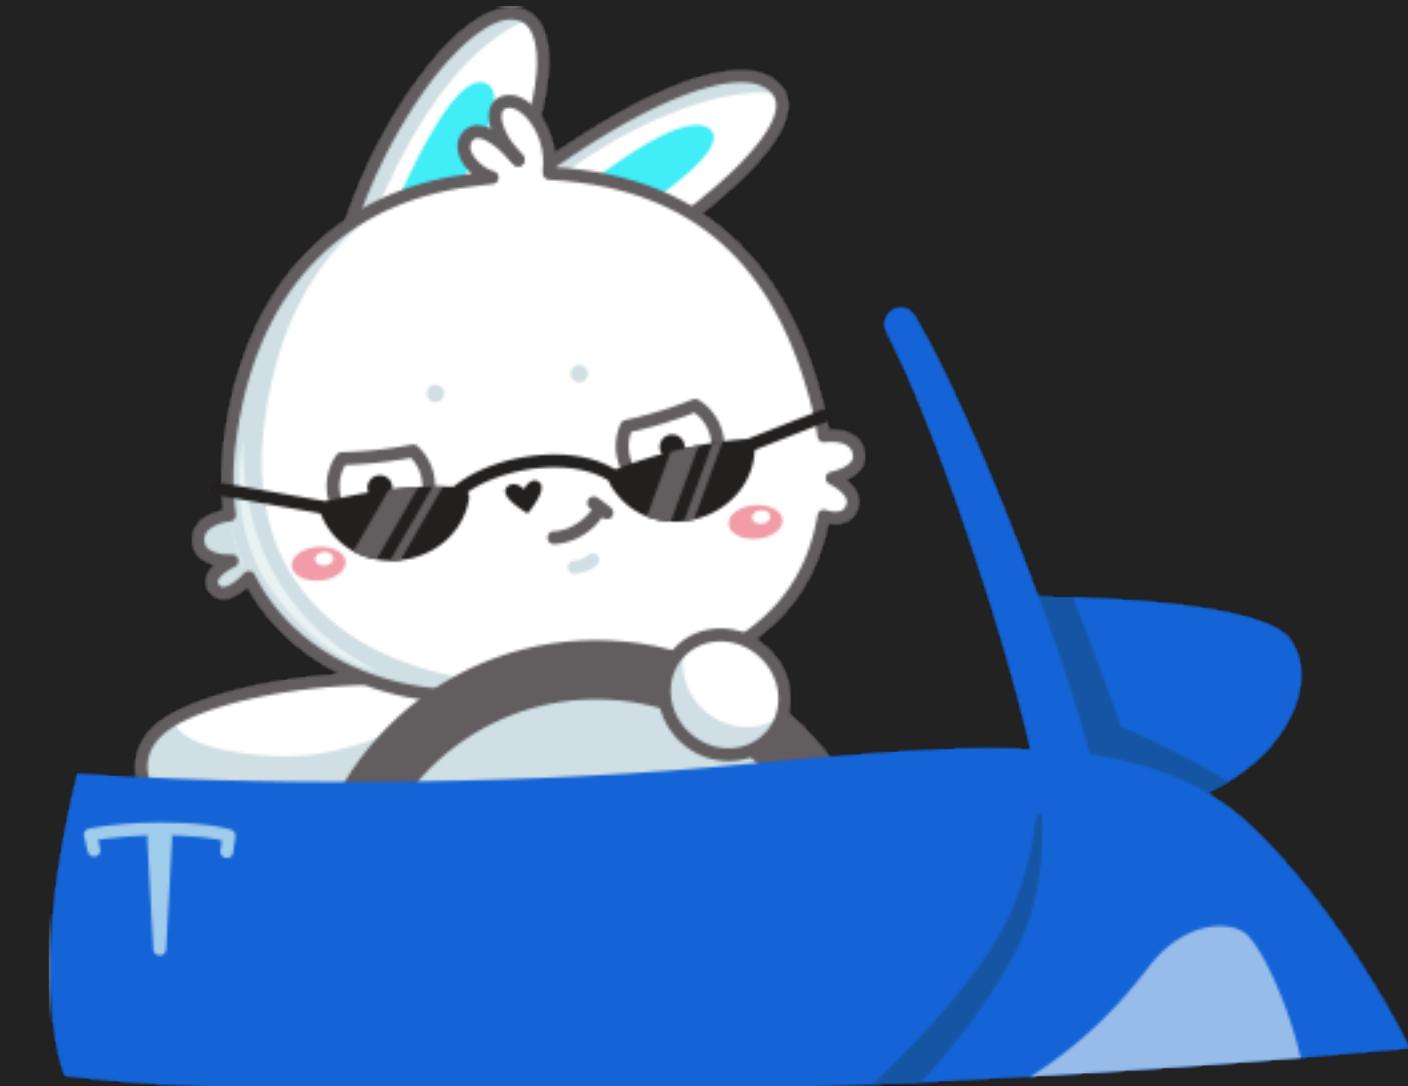

```
1 from concurrent.futures import ThreadPoolExecutor
2
3
4 def execute(func, times=1):
5     pool = ThreadPoolExecutor(max_workers=times)
6     futures = [pool.submit(func) for _ in range(times)]
7     return [f.result() for f in futures]
```

PROS & CONS

- ▶ If you want to prevent or find earlier:
 - ▶ Security issues
 - ▶ ...

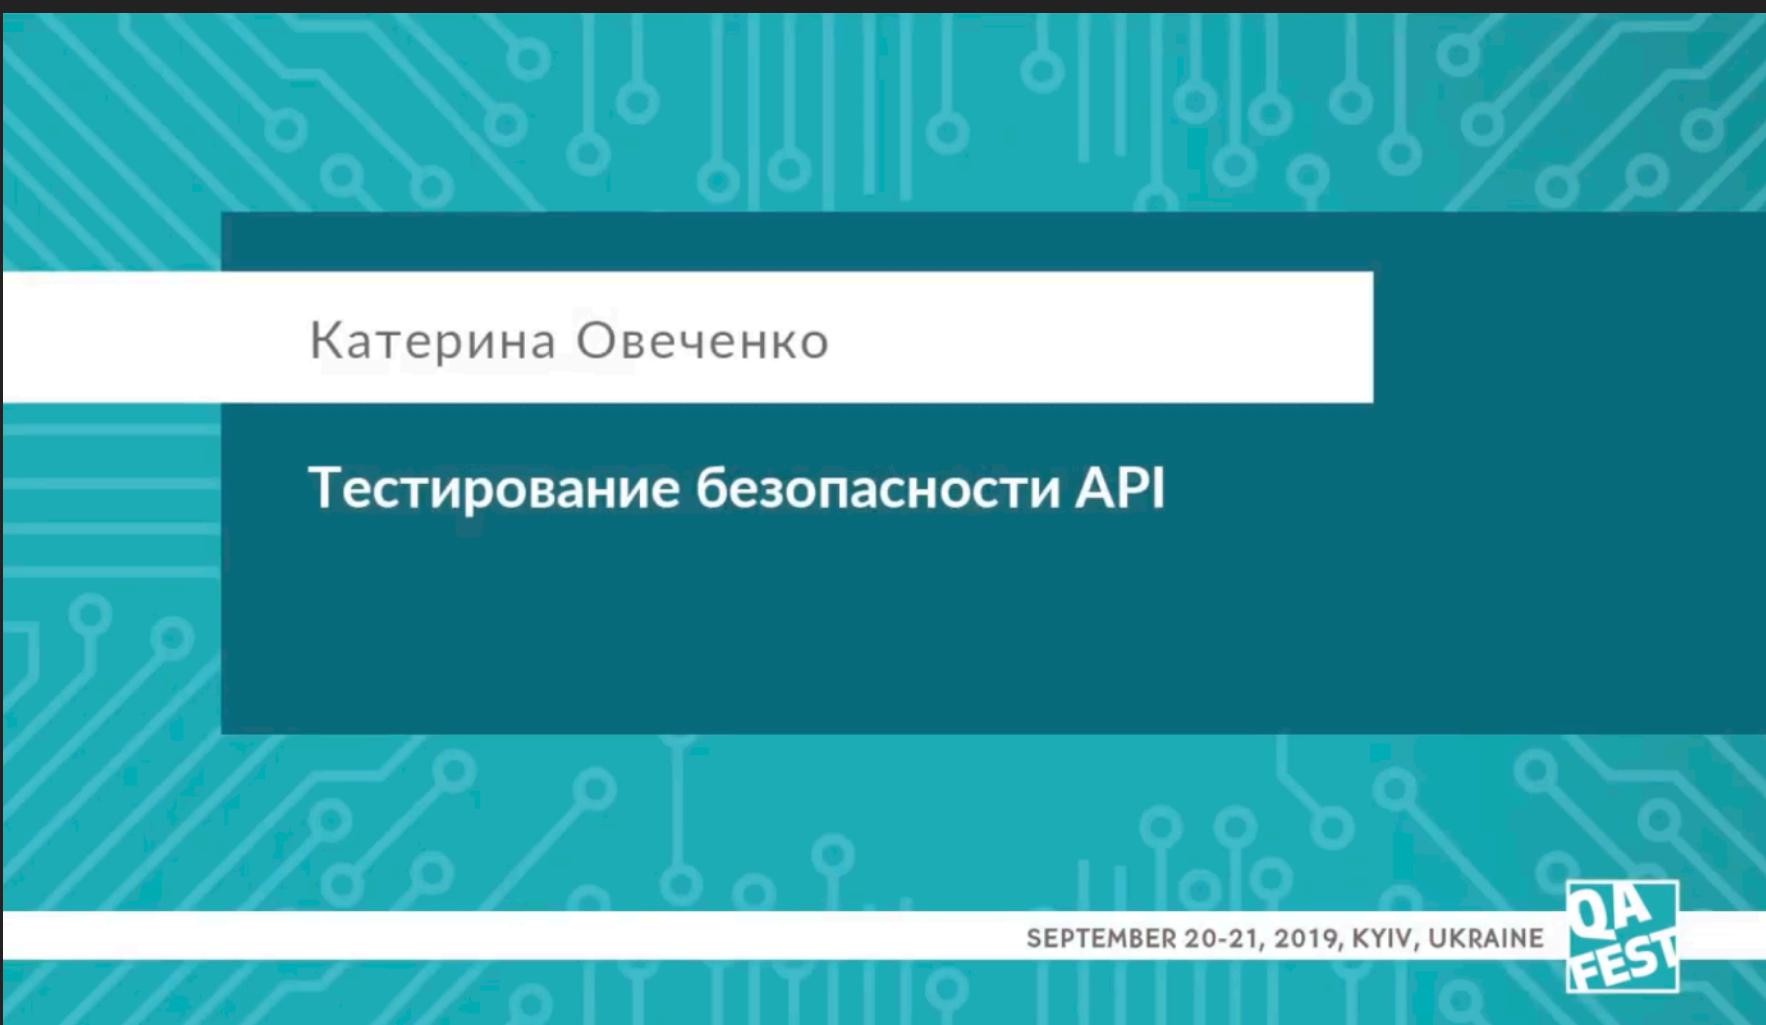

PROS & CONS

- ▶ If you want to prevent or find earlier:
 - ▶ Security issues
 - ▶ ...
- ▶ Sometimes tests fail → Knowledge mining
- ▶ Learning and investigation time

WHAT'S NEXT?

- OWASP API Security
- QA Fest 2019: Security API Testing

PROBLEM: A LOT OF MANUALLY MADE AUTOTESTS

- ▶ Every new service require much time

APPROACH

- ▶ API Schema (Swagger, GraphQL, Something custom*)
- ▶ Parsing
- ▶ Generate data for each type
- ▶ Fuzzing (send requests)
 - ▶ Each method
 - ▶ Each field
 - ▶ Check responses

APPROACH AND TOOLS

- ▶ Parsing schema
 - ▶ Swagger
- ▶ Property-based testing
 - ▶ Hypothesis

TOOLS

- ▶ Schemathesis (hypothesis-jsonschema)
- ▶ Swagger 2.0 / OpenAPI 3.0
- ▶ GraphQL
 - ▶ Full-featured support - in progress
- ▶ Requests
- ▶ Pytest (parametrization)

EXAMPLES: CONNECT TO SWAGGER SCHEMA

```
1 import schemathesis
2
3 schema = schemathesis.from_uri(
4     "https://my-cool-service.com/v2/api-docs",
5     verify=False
6 )
7
8
9 @schema.parametrize()
10 def test_no_server_errors(case):
11     ...
```

EXAMPLES: QUICK START FROM DOCUMENTATION

```
1 @schema.parametrize()
2 def test_no_server_errors(case):
3     # `requests` will make an appropriate call
4     response = case.call	verify=False)
5     # You could use built-in checks
6     # case.validate_response(response)
7     # Or assert the response manually
8     assert response.status_code < 500
```

EXAMPLES: REAL WORLD

```
1 1 @pytest.mark.parametrize("user_role", [...])
2 2 @schema.parametrize()
3 3 def test_no_server_errors(case, arrange_user, user_role):
4 4     user = arrange_user(role=user_role)
5 5     client = http_client.auth_session(user=user)
6
7 7     response = case.call(
8 8         headers=client.headers, cookies=client.cookies
9 9     )
10
11 11     assert response.status_code < 500, "Server error"
```

EXAMPLES: PROPERTY CONFIGURATION

```
1 from hypothesis import HealthCheck
2
3 @hypothesis.settings(
4     suppress_health_check=HealthCheck.all(),
5     max_examples=config.FUZZING_MAX_EXAMPLES
6 )
7 def test_no_server_errors(*args):
8     ...
```

EXAMPLES: BUILT IN VALIDATION RULES

```
1 1 @pytest.mark.parametrize("user_role", [...])
2 2 @schema.parametrize()
3 3 def test_no_server_errors(case, arrange_user, user_role):
4 4     user = arrange_user(..)
5 5     client = http_client.auth_session(..)
6
7 7     response = case.call(..)
8
9 9     case.validate_response(response)
```

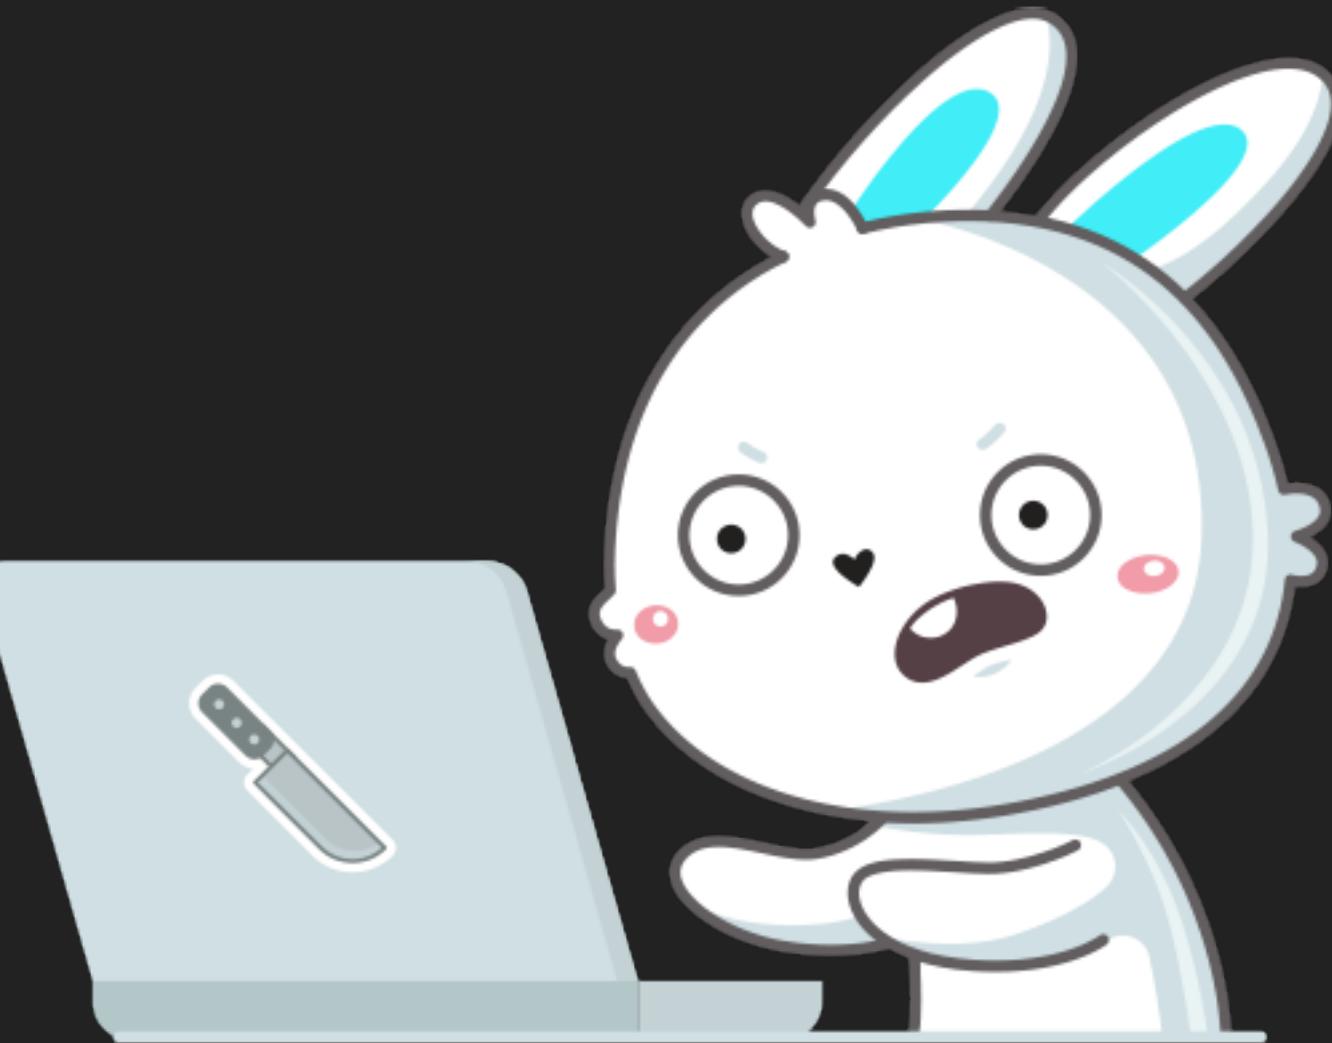

PROS

- ▶ Rapid start testing for new services:
 - ▶ Schema → few minutes → several 5xx errors
- ▶ Declarative approach:
 - ▶ Describe rules that should be validated
- ▶ Lazy test automation:
 - ▶ No need to write tests on every new API method

CONS

- ▶ Send all required fields and data that fits types
- ▶ Need to suppress warnings from Hypothesis
- ▶ Require up-to-date swagger schema
 - ▶ Could fail on schema parsing
- ▶ Pytest-xdist parallel issues
- ▶ Many layers → issues require time
- ▶ Many dependencies

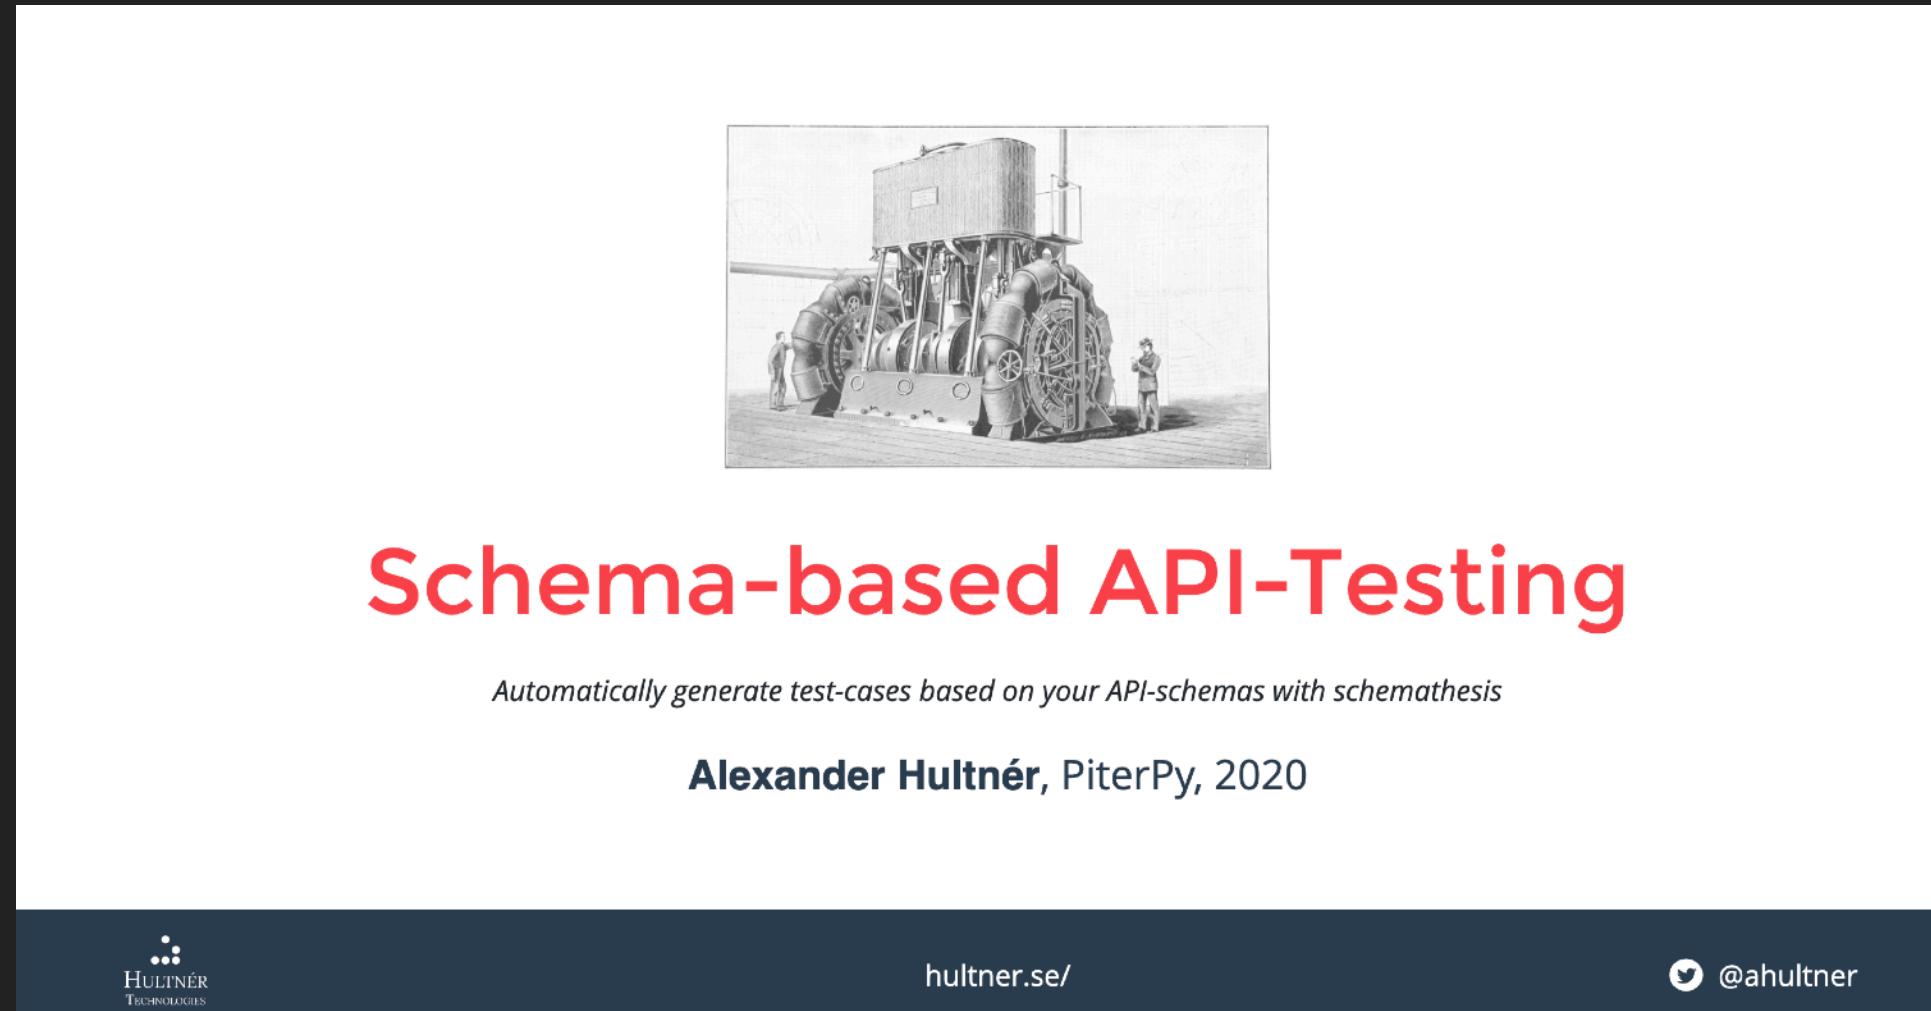

WHAT'S NEXT?

- Introduction to property-based testing (Hypothesis)
- Choosing properties for property-based testing (F#)
- Hypothesis documentation
- Heisenbug 2019 Piter: Property testing: Strategic automation for devs and SDETs

WHAT'S NEXT?

- PiterPy 2020: Schema-based API-Testing – Automatically generate test-cases with schemathesis
- Progress report and plan (2020-10-05)
- Habr (Russian)
- Medium (English)

REMEMBER ALL

- ▶ Architecture of your application
 - ▶ Approaches and tools
- ▶ Common approaches (Risk based scenarios)

REMEMBER ALL

- ▶ Next approaches
 - ▶ Random data generation
 - ▶ Data validation based on schemas
 - ▶ Base security checks
 - ▶ API Fuzzing

OUTSIDE THE TALK SCOPE

- ▶ Contract testing
- ▶ Security testing
- ▶ Performance testing
- ▶ 3rd party integration testing

QUALITY IS ABOUT WHOLE DEVELOPMENT PROCESS

- ▶ Shift-left & white box
 - ▶ Code review (at least unit tests) & code coverage analysis
 - ▶ Static code analysis, code formatters
 - ▶ Testability is one of software architecture quality attributes
- ▶ Shift-right & SRE
 - ▶ AB-testing, Canary releases, Feature toggles

THANK YOU!!!
